BOVINE MASTITIS - 2

Before & After Study

	Dec	Jan	Feb	Mar
Season prior to treatment	12	8	20	20
Season of treatment	9	20	3	4
			Nosode introduced 1 st February	

In this example, we have simply collected data from the herd, of incidence of mastitis (no. of cases per month) from the season before treatment and from the season of treatment (treatment with nosode). Nosode was introduced on the **1st February**, in the second season. The 'nosode' figures are in bold type.

There was dramatic improvement in the situation, coincidental with the start of the nosode treatment.

Results in graphic form:

Nosode introduced **1st February**, in the second season.

Discussion:

The problem with a 'before and after' trial, such as this, is that it is not possible to determine for certain, whether the effect is from the intervention or from some other 'unknown' factor. The results are nonetheless extremely suggestive of a strongly positive effect from the homeopathic intervention.
